

## Validation

- Two parts
  - Input validation
    - Using custom HTML, JavaScript
    - Original code, cannot be a package from somewhere
    - A message should tell what the user did wrong and how to fix
  - Use case validation
    - List all of the possible things the user(s ) could do with this application
      - Name document “UseCases” (with appropriate extension, docx, pdf, etc.)
    - Show that each work with corresponding results and repercussions
      - Ex: Advisor cancels an appointment, student is informed somehow, that time slot no longer appears, etc....
- All use cases “proofs” are shown with videos for quick grading
  - Can be several videos in playlist
